

# Climate Scenario Analysis

Origin Energy

Report 2019

**DRAFT - DO NOT CIRCULATE OR USE TO INFORM DECISIONS**

# Legal Disclaimer

This Report has been prepared by the 2° Investing Initiative (2°ii) a leading not-for-profit think-tank on climate related metrics and policies in financial markets. The Report summarises our Company Climate Scenario Analysis (CCSA) in relation to **Origin Energy** (the Company). The CCSA is our limited 'point in time' estimate of the alignment between the Company's revealed business plans for its power generation business in the period 2019-2024, versus the economic trends embodied in the International Energy Agency's (IEA's) 'World Energy Outlook' and 'Energy Technology Perspective' scenarios. This Report is made available through our PACTA portal and its use is subject to the Terms of Service agreed to by users of that portal. The methodology applied in the CCSA, its data inputs, assumptions and limitations, are set out in this Report and the Methodology Statement – Company Reports available at [www.transitionmonitor.com/company-reports/](http://www.transitionmonitor.com/company-reports/).

**Limitations and assumptions:** The CCSA does not purport to analyse all risks, opportunities or issues associated with climate change that may be relevant to the Company. Such issues may include (for example) physical or ecological impacts that may be caused by, or to, the assets and operations of the Company, and any climate-related litigation exposures. The CCSA utilises publicly-available information, and proprietary third party data obtained under licence, which 2°ii believes in good faith to be reliable. However, 2°ii makes no representation or warranty (express or implied) as to the completeness, accuracy or currency of such information or data, nor to the completeness, accuracy or currency of the information in this Report.

**No forecast or prediction:** The CCSA does not purport to generate, nor does this Report contain or comprise, forecasts or predictions. 2°ii neither makes nor implies any representation regarding the likelihood, risk or expectation of any future matter. In particular, 2°ii does not make any representation that by making the changes to the Company's revealed plans identified in the Report, the Company would be in compliance with any Sustainable Development Goals or the long-term warming goals of the Paris Agreement or achieve any stated climate targets. To the extent that any statements made or information contained in this Report might be considered forward-looking in nature, they are subject to risks, variables and uncertainties that could cause actual results to differ materially. You are cautioned not to place any reliance on any such forward-looking statements, which reflect our assumptions and methodology as applied to third party data and the Company's revealed business plans only as of the date of modelling or such earlier date as indicated in this Report. It is likely that the third party data, the Company's revealed plans, and the IEA scenarios will change in some way during the five-year time horizon, and our assumptions and methodology may also evolve and change during this time. 2°ii is not obliged to revise, or to publicly release any revisions to, this Report or to notify you if the data, revealed plans, assumptions or methodology change or become inaccurate.

**No financial advice:** The information contained in this Report is general in nature. It does not comprise, constitute or provide personal, specific or individual recommendations or advice, of any kind. In particular, it does not comprise, constitute or provide, nor should it be relied upon as, investment or financial advice, a credit rating, an advertisement, an invitation, a confirmation, an offer, a solicitation, an inducement or a recommendation, to buy or sell any security or other financial, credit or lending product, to engage in any investment strategy or activity, nor an offer of any financial service. **This Report does not purport to quantify, and 2°ii makes no representation in relation to, the performance, strategy, prospects, creditworthiness or risk associated with the Company or any investment therein, nor the achievability of any stated climate targets (of the Company, the defined market, an investor's portfolio or otherwise).** The Report is made available with the understanding and expectation that each user will, with due care and diligence, conduct its own investigations and evaluations, and seek its own professional advice, in considering the Company's financial performance, strategies, prospects or risks, and the suitability of any investment therein for purchase, holding or sale within their portfolio.

**IEA Scenarios:** The choice of any scenario should not be taken as any endorsement of it, nor any statement as to the accuracy or completeness of its methodologies or assumptions, nor as a general preference for it over any other economic scenario. 2°ii may carry out the CCSA using other economic scenarios. Users must form their own view as to the decarbonisation or economic scenarios, trajectories and models that are most appropriate to their circumstances. No explicit or implicit assumption is made in relation to the current or future alignment of the scenarios with the Paris Agreement or the climate-related policies of any government at international, national or sub-national level.

**TCFD and other climate-related financial reporting:** The CCSA and this Report may provide underlying data for climate-related financial reporting, including initiatives undertaken with regard to the Recommendations of G20 Financial Stability Board's Task-force on Climate-Related Financial Disclosures (TCFD). However, its use in isolation does not purport to provide 'TCFD compliance' or compliance with any other reporting requirements, and any data used should be subject to appropriate processes of verification and assurance.

**Exclusion of liability:** To the extent permitted by law we will not be liable to any user or to the Company for any direct, indirect or consequential loss or damage, whether in contract, tort (including negligence), breach of statutory duty or otherwise, even if foreseeable, relating to any information, data, content or opinions stated in this Report, or arising under or in connection with the use of, or reliance on, the CCSA or this Report.

# Executive Summary

## Origin Energy

This report by 2° Investing Initiative provides an assessment of **Origin Energy**'s power capacity by technology, its future alignment with climate transition pathways and evaluates its performance against other utilities in the Asian Pacific market.

### Installed Capacity 2019

**Origin Energy** has 5,814 MW of installed capacity with 4.1% coming from low carbon technologies. By 2024, it has no known plans for additional capacity.

	Renewables	Hydro	Nuclear	Gas	Oil	Coal
2019 Energy Mix (MW)	0	240	0	2,280	414	2,880
Planned Additions (MW) 2019-2024	0	0	0	0	0	0

### Comparison of investment plans with transition scenarios

**Origin Energy**'s planned capacity additions are compared to the different climate scenarios of the International Energy Agency (IEA) for each technology as described on page 4. The additional capacity planned by **Origin Energy** aligns it with the SDS for Gas capacity and with the CPS for Hydro, Coal and Oil capacity. It has no exposure to Nuclear and Renewable capacity.

### Changes in Capacity required to align with the SDS by 2024

In order to align with the Sustainable Development Scenario (SDS) by 2024, **Origin Energy** would require the following changes in capacity by technology to its current plans by 2024:

	Renewables	Hydro	Nuclear	Gas	Oil	Coal
2024 Planned Energy Mix (MW)	0	240	0	2,280	414	2,880
Required Changes (MW)	664	34	0	73	-129	-527

# Introduction

## Key Questions

This climate scenario report addresses five key questions regarding **Origin Energy**'s climate strategy:

1. How does the company's current capacity mix compare to the power market's capacity mix? (Page 6)
2. How do the company's investment plans compare to different climate transition scenarios? (Page 7)
3. How does the company's planned capacity mix by 2024 compare to the scenario-aligned market? (Page 9)
4. How can the company adjust its investment plans to align with the SDS by 2024? (Page 10)
5. How does the company's climate alignment compare to other utilities? (Page 11)

This document solely presents the results of the above analyses. For more information on the methodology, scenarios, underlying data, and limitations, please refer to "A Guide to Company Scenario Analysis" available at [www.transitionmonitor.com](http://www.transitionmonitor.com).

## Why is scenario analysis important?

Scenario analysis is highlighted within by the Task Force for Climate-related Financial Disclosures (TCFD) as a recommended tool for understanding the resilience of organization's strategies under different climate related scenarios. It supports both companies and investors in developing action plans as a response to the Paris Agreement.

## How does this scenario analysis work?

This scenario analysis is an assessment of the physical assets owned by **Origin Energy** and its investment plans in new capacity, based on third party data. The share of responsibility, defined by climate scenarios that outline possible transition pathways, has been allocated to the company according to the regional distribution of its power capacity. Further analyses allow us to understand how **Origin Energy** is currently, and in the future, exposed to climate transition risks and opportunities.

## How can it be used?

For **Companies**, this analysis provides a comparison of its performance relative to peers, and an understanding of how climate change responses differ. It also provides an overview of how planned capacity changes compare to the climate scenarios developed by the International Energy Agency (IEA). It highlights potential areas for action by companies.

For **Investors**, this report may be used to inform their decision making by highlighting the alignment of the trajectories of companies in their portfolio with different climate scenarios and therefore their potential exposure to transition risks. The information provided in this report can support engagement activities with companies and may provide data for reporting requirements.

For **other stakeholders**, such as policy makers or NGOs, this may support the development of guidelines for reporting or research.

**What this report doesn't do:** this report is not a financial analysis of the company and should not be taken as investment advice.

Data used in this report is based on third party data from GlobalData (effective as of 12/2018) and may vary from what is announced by the company in annual reports; the data in this report reflects an aggregation of the known subsidiaries of **Origin Energy** aggregated under the equity share principle. Details regarding the data sources and processing can be found on page 14. Companies are invited to review the data and provide feedback to assist in improving the underlying data sets by emailing 2dii at [transitionmonitor@2degrees-investing.org](mailto:transitionmonitor@2degrees-investing.org).

# Reading the Report

## Report Contents

This report consists of three elements:

1. **Company profile:** information about the current installed capacity of the company, its technology mix and its global capacity distribution.
2. **Scenario Analysis:** results of the comparison of the company investment plans to different scenarios and the market.
3. **Peer Comparison:** a comparison of the scenario analysis results to peer companies operating in the same market.

## Key Concepts

To understand the results presented in this report, some of the key concepts are summarised below. For detailed information about the methodology, scenarios and underlying data, please refer to “A Guide to Company Scenario Analysis” available at [www.transitionmonitor.com](http://www.transitionmonitor.com).

**Low carbon technologies:** This report treats renewables, hydro and nuclear as low carbon technologies, and gas, oil and coal capacity as high carbon technologies. Renewable technologies include solar, wind and biomass. While acknowledging other sustainability issues linked to different technologies, the analysis in this report focuses on the low carbon versus high carbon split.

**Capacity build out:** Refers to the investment plans of the company in new power capacity.

**Capacity vs Generation:** This report uses capacity (MW) rather than generation (MWh) as a metric. The generation of electricity from each technology differs by a capacity factor that varies due to a multitude of factors.

**Capacity mix:** The distribution of the power capacity of **Origin Energy** is used as an indicator. This refers to the share of installed capacity that **Origin Energy** has in each technology.

**Market:** The market referred to in this report is designated based on the country of domicile of **Origin Energy**. The market therefore includes all Asian Pacific utilities.

**Aligned with a scenario:** To be aligned with a scenario implies that the capacity build out of the company matches what is expected based on the roadmaps developed by the IEA.

**Scenarios:** Four IEA scenarios are included in this report’s analysis: three are sourced from the World Energy Outlook 2018 (WEO 2018) and one from the Energy Technology Perspectives 2017 (ETP 2017) and are detailed in Table 1. These have been chosen due to their regional and technological granularity. The SDS is used as the benchmark scenario. The scenarios consist of technology roadmaps that outline the technological changes required in each designated region globally. These roadmaps have been applied to each asset to calculate the change that would be required by asset. This is aggregated to the region and then the company to determine the overall expected change required.

**Table 1:** Overview of the IEA scenarios used in the analysis.

Scenario Full Name	Abbreviation	Estimated temperature increase by 2100*	Source
Beyond 2Â° Scenario	B2DS	1.75Â°C	ETP 2017
Sustainable Development Scenario	SDS	1.7-1.8Â°C	WEO 2019
New Policy Scenario	NPS	2.7Â°C	WEO 2019
Current Policy Scenario	CPS	3.3Â°C	WEO 2019

\*The temperature rise estimates for the B2DS, SDS and NPS are specified by the IEA. The CPS estimate is taken from Climate Action Tracker’s 2018 Warming Projections Global Update.

# Company Profile

This section outlines the current and future capacity mix of **Origin Energy**. Figure 1.1 shows the changes in capacity in each technology between 2019 and 2024. From this, one may be able to extrapolate whether the company’s transition risks increase or decrease. Figure 1.2 and 1.3 show the geographical distribution of power generation assets by capacity and capacity mix.

Figure 1.1: Company capacity mix in 2019 and 2024.

Figure 1.2: Geographical distribution of the company’s power generating assets in 2019.

Figure 1.3: Overview of the company’s capacity mix and total capacity in the largest countries by total capacity in 2019.

# Current Alignment

## How does the current capacity mix of Origin Energy compare to the market?

This section provides an overview of the diversification of **Origin Energy**'s capacity across high and low carbon technologies. In order to meet the goals of the Paris Agreement, the IEA broadly signals that the share of "low carbon technologies" must increase while the share of "high carbon technologies" must decrease.

As such, the company's capacity mix is presented both in terms of the share of low carbon technologies of its total capacity, and the breakdown of its capacity by technology specifically. The market is representative of all utilities in the Asian Pacific power market.

### A) Low and high carbon capacity mix percentage

### B) Capacity mix by technology percentage

**Figure 2.1:** Comparison of the company's capacity mix to the market's capacity mix in 2019 by A) low carbon vs high carbon split and B) by technology.

**Origin Energy has 4.1% of its power capacity in low carbon technologies compared to 33.2% in the market. Origin Energy has a higher share of Gas and Oil capacity than the market; it has a lower share of Coal and Hydro than the market while it has no Nuclear and Renewable capacity.**

# Trajectory

## How do the capital expenditure plans for different technologies compare to the climate scenarios?

Plans to build or retire capacity over the next 5 years can be used to compare **Origin Energy**'s planned changes in capacity to different International Energy Agency (IEA) scenarios. These scenarios present possible transition pathways and the changes in capacity required if each company in the world were to align its capacity accordingly.

The expected change in capacity by technology as per the IEA scenarios has been applied to the power capacity of **Origin Energy** to calculate the changes required under each scenario. This report benchmarks the company against the Sustainable Development Scenario (SDS), though the following charts also show the Beyond 2 Degree Scenario (B2DS), the New Policy Scenario (NPS) and the Current Policy Scenario (CPS).

Alignment with climate scenarios may vary by technology. For each technology, figure 3.1 summarises the different IEA scenarios that **Origin Energy**'s investment plan aligns with. It is important to note that these charts are independent of the current exposure to each technology (except by determining the starting point in terms of capacity). The initial (2019) weighting of a technology within the company's capacity mix is not reflected in these charts.

**Figure 3.1:** Scenario outcome of the build out plans for each technology by 2024. This summarises the results of the trajectory charts in 2024.

**The additional capacity planned by Origin Energy aligns it with the SDS for Gas capacity and with the CPS for Hydro, Coal and Oil capacity. It has no exposure to Nuclear and Renewable capacity.**

The charts on the following page (figure 3.2) provide additional details on how **Origin Energy**'s investment plans for each technology align with four IEA scenarios over the next five years. They also show the market's trajectory for context.

*The background colours represent how the trajectory of a technology should progress under the relevant scenario based on the geographical exposure of the company's power capacity. The solid and dashed lines represent the production plans of the company and those of the utility market scaled to the starting point of the company. In the chart to the right, the company's investment plans for this technology lie between the SDS and NPS trajectories. The difference in 2024 between the company's production plan and the end point for a specific scenario indicates the change in capacity that would be required for alignment. The market capacity can be compared to the company plans as a relative indicator only, as the scenarios are specific to the company. In this case, the company is building out more of this technology than the market.*

# Trajectory

Origin Energy has no  
Renewables capacity.

Origin Energy has no  
Nuclear capacity.

**Figure 3.2:** illustrates how **Origin Energy**'s planned capacity changes in each technology compare to different IEA transition pathways and the market.

# Future Alignment

## How will the planned capacity mix of Origin Energy compare to a Asian Pacific utility market aligned with the SDS in 2024?

The capacity mix of **Origin Energy** in 2024 is based on its capacity mix in 2019 plus planned capacity changes between 2019 and 2024. The aligned market capacity mix shows what would be expected if the current Asian Pacific power market were to develop over the next five years in accordance with the SDS.

If the company has a lower amount of low carbon technologies than the theoretical aligned market, it may be exposed to higher transition risks based on the technological trajectories outlined by the IEA.

Figure 4 shows that **Origin Energy** has an capacity mix in 2024 which has 38.7% percentage points or 90.4% less low carbon capacity than an aligned market.

A) Low and high carbon capacity mix percentage

B) capacity mix by technology percentage

Figure 4.1: Comparison of the company capacity mix to the market capacity mix in 2024.

By 2024 Origin Energy has a higher share of Coal, Gas and Oil capacity than the market aligned to the SDS; it has a lower share of Hydro, Nuclear and Renewable capacity than the market aligned to the SDS.

# Achieving Alignment

## What changes in capacity are required by Origin Energy to align itself with the SDS?

For **Origin Energy** to align itself with the SDS by 2024 based on the company's current capacity, the following capacity changes by technology are required.

**Figure 5:** Changes in capacity required to align with the SDS.

**By 2024, Origin Energy requires additional investment in Hydro and Renewable capacity to be aligned with the SDS, as well as retirements of Coal and Oil.**

In some cases, the company's investment plans may outperform the capacity required to align with the SDS. If the company's investment plan for low carbon technologies exceeds scenario targets, no retirements are specified. Similarly, no additions are specified if the company's plans already meet the transition pathways for high carbon technologies.

# Comparison Between Utilities

## How does the current capacity and future planned capacity of Origin Energy for low carbon technologies compare to other utilities in the Asian Pacific market?

In this section, we represent the current capacity mix of **Origin Energy** relative to the other utilities in the Asian Pacific market, as well as its investment plans. Figure 6 highlights:

- On the x-axis, the percentage of low carbon technologies within the capacity mix in 2019.
- On the y-axis, the percentage of planned additions by 2024 which are low carbon.
- The 2019 total power capacity of each company via the size of the circles. Each circle represents a separate utility.

**Origin Energy** is highlighted in black.

**Figure 6:** % planned future capacity in low carbon technologies vs % current capacity in low carbon technologies.

Companies fall into one of four categories:

1. Upper Right: These companies are currently heavily invested in low carbon technologies as a share of the capacity mix, and have plans to expand investment in these technologies even further.
2. Lower Right: These companies are currently heavily invested in low carbon technologies as a share of the capacity mix. However, their planned capacity is either primarily high carbon, or they have no planned capacity additions.
3. Upper Left: These companies are not currently heavily invested in low carbon technologies, as a share of the capacity mix. However, their planned capacity additions are primarily low carbon.
4. Lower Left: These companies are neither currently heavily invested in low carbon technologies as a share of the capacity mix, nor have plans to build these out in the future.

# Comparison Between Utilities

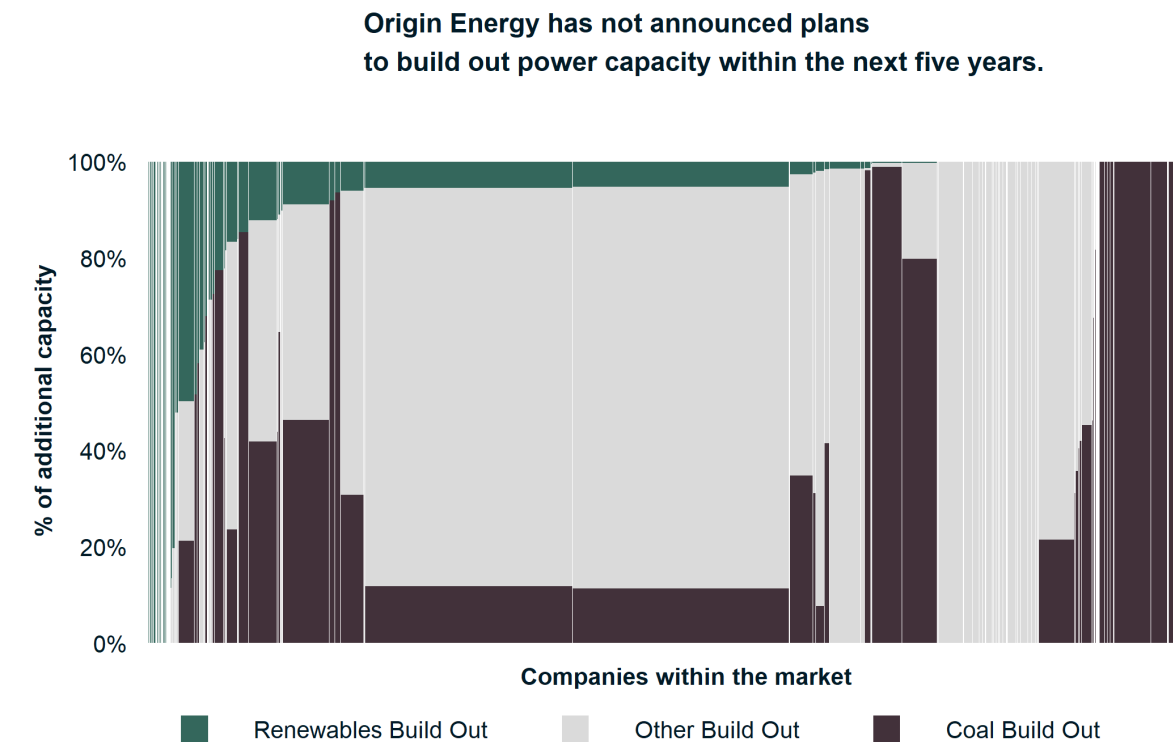

## How do the investment plans in new capacity of Origin Energy compare to other utilities?

This section displays the investment plans by technology of all companies in the Asian Pacific market. It highlights the distribution of the global capacity build out of these companies, in renewable and coal capacity.

Figure 7 shows the planned capacity changes between 2019 and 2024. The width of each bar represents the capacity of the build out of each company in the market: i.e. a company with 5 times as much capacity build out will be 5 times as wide as another company. This represents the cumulative additional capacity only and does not reflect net retirements.

11.7% of companies in the Asian Pacific market have plans to invest in renewables (11.7% of new capacity) while 6.2% of companies have plans to invest in new coal capacity (30.5% of new capacity).

The chart shows the build out volume of renewables and coal capacity for each company.

**Figure 7:** Breakdown of new power capacity by technology with a focus on Renewable and Coal power. The width of each bar represents the capacity of the build out of each company within the market.

# Market Share

## How does Origin Energy’s market share of each power technology evolve between 2019 and 2024?

This section shows how **Origin Energy**’s market share in key technologies is expected to develop between 2019 and 2024 and what the company’s future positioning relative to the market will be.

Figure 8 shows changes in the company’s renewable and total power capacity market share, defined as the % of total capacity in each technology over the entire Asian Pacific power capacity in each technology.

**Figure 8:** The above charts show how **Origin Energy**’s market share of the Asian Pacific market develops for renewable and total power capacity. The chart on the left provides a comparison to the Asian Pacific utility market given current plans, and the chart on the right shows how this would develop if the market were aligned with the SDS.

**The total market share of Origin Energy is set to decrease given the actual plans of the market as well as the market under the SDS by 2024. Its market share of renewable capacity is not set to change given the actual plans of the market and the market under the SDS by 2024.**

The market share for each technology represents the company’s capacity as a percentage of the capacity of all utilities in the market (actual and aligned) including current announced plans. If the company’s renewables market share is decreasing over the next 5 years, this suggests that **Origin Energy** plans to build out renewables capacity at a lower rate than the utilities market as a whole.

# Data Sources

2dii scenario analysis is based on forward-looking power asset data from GlobalData paired with company ownership information from Bloomberg. GlobalData provides highly granular information on individual power plants, including plant ownership, technology employed, location as well as active and pipeline capacity values. The company's current capacity mix was calculated by aggregating capacities across active plants where the company is listed as owner, weighted by an ownership stake. 5-year investment plans were calculated by aggregating capacities from plants with years online between 2019 and 2024. Power capacity was allocated from subsidiary companies to the company based on company ownership data sourced primarily from Bloomberg. The result is a forward-looking capacity mix for **Origin Energy** that serves as starting point and basis for comparison for scenario analysis. It does not include electricity sourced under power purchasing agreements.

Self-reported capacity mix data was taken from the company's website or annual report and compared to the capacity mix used in this report. The comparison revealed a discrepancy of 78.8% (see figure 9). Reasons for discrepancy fall into three categories:

1. We take asset data and ownership information from two major data providers: GlobalData and Bloomberg. The data we receive from these sources may in some cases be incomplete or contain errors. Errors may include missing assets, missing or inaccurate parent-subsidiary information, and missing or inaccurate asset ownership data.
2. We allocate capacity from subsidiaries to parent companies according to the following rules: If a subsidiary company is private/unlisted, 100% of its capacity is allocated to the parent company holding the controlling stake. If a subsidiary is public/listed, the non-free float portion of its capacity is allocated to the parent company holding the controlling stake. No power capacity is allocated to parent companies holding non-controlling stakes.
3. Data sourced from GlobalData is effective as of June 2019, and data from Bloomberg is effective as of 2018 Q4. This may differ from the effective dates of company reported data.

The capacity mix data is still undergoing quality review. As part of the quality review process, 2dii reached out to all companies included in the reports to seek edits and clarifications to the underlying data. Please review the legal disclaimer for further information about the limitations of the data.

Origin Energy Ltd reports 2,922 MW for which the technology is not specified.

Effective date of company-reported data: 30/09/2019

**Figure 9:** Comparison between the power capacity provided in the company reports published by the company to the aggregation of data completed by 2dii.

# Company Statement

Companies were given the opportunity to respond to a draft of this report, to comment on both the data used and other qualitative elements of their sustainability policies that may not be captured in the analysis above. As a company, if you would like to make a similar comment or edit the content of this text, please be in contact with us at [transitionmonitor@2degrees-investing.org](mailto:transitionmonitor@2degrees-investing.org).

## Company Statement:

Origin unequivocally supports the United Nations Framework Convention on Climate Change's Paris Agreement, and actions consistent with ensuring any rise in global temperatures is limited to a maximum of 2°C above pre-industrial levels. As a major Australian energy provider, we acknowledge the role we play in addressing climate change. We believe the electricity sector should be responsible for more than its proportional share of any national carbon reduction measures and we support a national goal of net zero emissions in the electricity sector by 2050 or earlier. \$ \$ In 2017 Origin became the first Australian company to set an emissions reduction target approved by the Science Based Targets initiative (SBTi). Origin originally committed to setting a decarbonisation target in 2015 when we signed up to We Mean Business, a global coalition of businesses accelerating corporate action on climate change. In December 2017, we made a formal, public commitment to halve our direct (Scope 1 and Scope 2) carbon emissions by 2032, and to reduce our indirect (Scope 3) emissions by 25% by 2032 (from a FY2017 baseline). Origin also adopted the Task force on Climate-related Financial Disclosures (TCFD) recommendations in our annual reporting from FY2018. \$ \$ We have a five-pillar approach to progressively decarbonise our business, achieve our emission reduction targets and contribute to Australia's emissions reduction targets. Origin's five pillars of decarbonisation are: \$ \$ 1. Exit coal-fired generation by 2032. \$ \$ 2. Significantly grow renewables in our portfolio. \$ \$ 3. Utilise our strong gas position as a lower-emissions firming fuel. \$ \$ 4. Empower customers with cleaner, smarter energy solutions. \$ \$ 5. Demonstrate leadership in climate change advocacy. \$ \$ As a major retailer and generator of electricity, Origin is well positioned to accelerate the development of renewable generation. Given we sell more electricity than we generate ourselves we have the opportunity to bring renewables into our portfolio through contracting or building. We note that 2°ii's methodology only considers owned generation, and not contracted generation. However, since March 2016, Origin has underwritten the development of more than 1,200MW of new solar and wind generation via long-term power purchase agreements (PPAs). By 2020, Origin is targeting renewables and storage to contribute more than 25% of our generation mix. We believe 2°ii's methodology does not present a fair representation of Origin's generation portfolio and commitment to renewable energy, as these long-term PPAs signed by Origin have underwritten the development of these renewable generation assets. \$ \$ Origin also has Australia's largest fleet of gas-fired peaking power stations which positions us very strongly to further support the growth in intermittent renewable generation in Australia. We have also committed to closing Eraring, our only black coal-fired power station, by 2032. Eraring is Australia's largest power station and plays an important role in maintaining the reliability and affordability of the Australian energy market during the transition to a decarbonised world. \$ \$ For more information on Origin's climate strategy and performance, please see our 2018 Sustainability Report: <https://www.originenergy.com.au/about/sustainability/sustainability-reports.html> \$
